

In this application, the user puts in a request to the client (DNS) which hits Route 53. The user is presented with a login screen (or something of the like). The user is validated through Amazon Cognito. The request is sent back to the Client and the user is validated. (1)

The user then makes a request or does something administrative which hits API Gateway, and the administrative thing either hits the Amazon DynamoDB or the S3 bucket to change data. (2)
